

Brick Replacement, (complete filling).

Sometimes, particularly with old walls and buildings, bricks can crumble and even fail completely. If left untreated, this can affect the building's structural integrity. But replacement is an intricate and often time consuming process. Ensuring a good quality fill is essential for structural reinforcement, but by using conventional methods this is often difficult to achieve.

The Point Master once again makes this process simple by completely refilling the joint ensuring the restoration of structural integrity.
