

Re-Pointing Deep Joints & Stonework.

The fast flow rate and feedback through the handle enables the Point Master to be extremely effective on Stonework such as flint.

Results are achieved faster and much more accurately than by traditional methods, where the mortar would have to be "thrown" into the joint manually.

Because the Point Master is designed to ensure fill of the cavity "from the back", the mortar recess is always completely filled. This ensures the best repair in the shortest time.

When repairing or re-pointing always remember to remove all the loose and powdery mortar back as far as safely possible. Then dampen the cavity and existing mortar to ensure the best adhesion.
